

ABSTRACT

A system, apparatus, and method are provided for providing uninterrupted media streaming by accessing multiple network sites. According to one embodiment of the present invention, in response to a request from a client for media content, a list of preferred edges sites is generated. The list is then forwarded to the client. A first site from the list is accessed and requested for providing the media content to the client. In the event of a disturbance, a second site from the list is accessed and requested for providing continuous and uninterrupted streaming of the requested media content.
